Fishing for Answers

The Gulf of Mexico’s Dead Zone

Kristi Hannam, SUNY-Geneseo
Revised by Shannan Muskopf for High School AP Biology
Summer at the Seafood Shack

Susan had moved in with Aunt Janet in Louisiana for the summer. She wanted to enjoy the sun and the beach, and save some money for college next fall. A week ago, she found a job as a waitress at Captain Joe’s Seafood Shack.

At lunch, a businessman asked: “Where’s the shrimp from anyway?”

She’d been asked this twice before already, so she knew the answer. “From Thailand.”
The next morning, Susan and Aunt Janet were eating breakfast while watching boats on the Gulf. Aunt Janet pointed. “See that boat with the funny stuff sticking out the back? That’s George. He’s a shrimper.”

“A shrimper? Then why does Captain Joe buy shrimp from Thailand?”

“I don’t know, why don’t you ask him!”
Business Decision

Captain Joe was busily setting up lunchtime plates when Susan found him.

“If there are shrimp in the Gulf, why do you buy shrimp from Thailand, Captain Joe?”

He stared at her, annoyed by the interruption. “Too expensive!” he grunted.

Quick Discussion:

In your group, find out what the favorite kind of shrimp is?

(fried, scampi, shrimp cocktail, popcorn…)

Take the poll!
At Aunt Janet’s that evening, Susan found her aunt sitting on the front porch talking to George. After introducing herself, Susan asked him, “Is Captain Joe’s the only restaurant around here that doesn’t serve local shrimp?”
“Definitely not,” George said in reply to Susan’s question. “Most of the area right off the coast here isn’t good for fishing or shrimping anymore. Restaurant owners can get cheaper shrimp from farms in Asia or South America,” he added.
George continued: “People around here have a lot of different ideas about why shrimp are going away. Some think hurricanes like Katrina are to blame, others think overfishing, pollution, or climate change are the cause. I don’t know for sure, but something has definitely happened – people are calling our part of the Gulf a *Dead Zone* – and it seems to be growing every year.”
Question 1: What is the dead zone and what are the economic impacts it is having on the Gulf?

Dory: “Hey, it’s krill!”
Question 2: Consider the food web shown below.

a) Where would you put shrimp? (Create a food chain.)

b) How will decreased amounts of shrimp affect other species?
3: Based on information from the locals, 5 hypotheses have been proposed. Which one do YOU think is correct?

A. Overfishing has depleted shrimp populations.

B. Pollution has killed off shrimp populations.

C. Rising water temperatures caused by climate change have made the habitat inhospitable to shrimp.

D. Hurricane Katrina (2005) destroyed all the shrimp and their habitat.

E. BP Oil Spill (2010)
The five working hypotheses for the Dead Zone are:

- Hurricane Katrina (2005)
- Pollution
- Climate change
- Overfishing
- Oil Spill (2010)

Question 4: What data would you need to collect to support or reject the hypothesis that overfishing has resulted in the dead zone?
The graph shows annual changes of CPUE for brown shrimp in areas of the Gulf of Mexico. The colored bars are “decadal means.” They show the average CPUE for a span of ten years (CPUE = catch per unit effort). Data: James Nance, National Marine Fisheries Service.

5. Summarize the data of this graph, what does it tell you about average shrimp catch over time?
6: Which hypotheses does this graph NOT support?

A. Hurricane Katrina
B. Pollution
C. Climate Change
D. Overfishing
E. Oil Spill

Explain your reasoning.
(Hint: Consider dates)
Watching the local news that night, Susan saw an image of the Gulf Coast at the mouth of the Mississippi River that caught her attention:

7. What do you think the arrow is pointing to?
8: Which hypothesis does the evidence in this image support?

A. Hurricane Katrina  
B. Pollution  
C. Climate Change  
D. Overfishing
Of her original hypotheses, Susan decided the evidence suggests she should explore the pollution hypothesis:

- Hurricane Katrina
- Pollution
- Climate Change
- Overfishing
- BP Oil Spill
Susan decided to investigate the sediment plume to see if there was a link to the disappearing shrimp in the Dead Zone.

Her research revealed the following map:

Take the watershed poll. What is your favorite (water) vacation spot?
Susan realized that runoff from an enormous area could be causing the sediment plume.

BUT:

- The SIZE of the Mississippi River watershed probably hasn’t changed in thousands of years.
- People have been shrimping and fishing in the Gulf for over 100 years.

9. So WHAT could be causing the problem now? What has changed in the last 100 years?

Source: USGS Fact Sheet 016-00

Use poll to brainstorm ideas. Submit at least one from your group.

Vote on others’ submissions.
10. What does this figure tell you about the runoff to the Mississippi River basin over time?

![Graph showing nitrate concentrations in selected rivers]

Figure 3. Average annual nitrate concentrations in selected rivers during 1905–07 and 1980–96.

Source: USGS Fact Sheet 135–00
11. What is the relationship between streamflow and nitrate flux?

Figure 4. Annual nitrate flux and mean annual streamflow from the Mississippi River Basin to the Gulf of Mexico.

Source: USGS Fact Sheet 135–00
12: What do these figures tell you about the runoff to the Mississippi River basin over time?

A. Annual nitrate concentrations have increased over time.
B. Stream flow has remained constant over time.
C. The biggest source of nitrates is the area farthest from the Gulf of Mexico.
D. Only A and C.
E. A, B, and C are true.
Susan recalled a figure from her biology course.
13: What is the most likely source of nitrogen in runoff?

A. Fossil fuel emissions.
B. Organic matter.
C. Leaching of nitrates from nitrification.
D. Fertilizer runoff.
14. a) Which source(s) of nitrates has increased?  
   b) Which has remained relatively constant?
Susan’s Question

Susan realized that her Internet research had distracted her from her original question about shrimp. How could increased nitrates be connected to decreased fish and shrimp populations?

She had figured out this much:

a) Nitrates flow into the Gulf of Mexico from the Mississippi River watershed (especially states further north).

b) The nitrates are carried by the freshwater river into the saltwater Gulf of Mexico.
Interior Watersheds of the Mississippi River Basin

Largest river basin in North America.

Third largest basin in the world.
Includes 70 million people, 30 states.

One of the most productive farming regions in the world:
~60% of the basin is cropland (corn, soybeans, wheat)
~20% woodland,
~20% barren land,
~2% wetland, and
~0.6% urban land

(Goolsby and Battaglin, 2000)

Source: USGS Fact Sheet 016-00

*
15: When the freshwater river flows into the saltwater Gulf, what do you predict will happen?

A. The freshwater and the saltwater will mix, lowering the overall salinity of the Gulf.
B. The warmer freshwater will sink to the bottom of the Gulf, and the colder saltwater will float above.
C. The less dense freshwater will float on top of the more dense saltwater.
D. The amount of freshwater entering the Gulf is so small compared to the total volume of the Gulf that there will be no noticeable effect of the freshwater input.
Temperature & Salinity Layering

16. Describe what happens when warm water meets cold water.
What Happens Next?

Excess nitrogen and more sunlight in surface waters leads to algae blooms.

The algae bloom provides food for zooplankton such as copepods.

Copepod wastes and dead algae sink to the bottom of the Gulf and decomposition lowers oxygen levels.

Continuing decomposition by bacteria lowers oxygen levels even more.
17. Algae are producers at the base of the food chain. Explain why the algae bloom here is actually BAD for shrimp and other organisms that live in the bottom layer of the gulf.
Eutrophication leads to hypoxia in the benthic waters of the Gulf

- Normal oxygen levels: ~ 4.8 mg/L
- Hypoxia: < 2-3 mg/L
- Anoxia: 0 mg/L

18. Define the terms used in this case study

   (in your own words, google if necessary)

a) Benthic
b) Eutrophication
c) Hypoxia
Pause and check out this gallery on algae blooms:

Source: http://www.eco-check.org/forecast/chesapeake/methods/
19. In what area(s) are the most severe cases of hypoxia? How do you know?
20. a) Does the evidence you’ve seen so far mean that climate change and overfishing are NOT to blame for the decline of the shrimp fishery?

A. Yes
B. No

b) What data would you need to gather to provide evidence for the climate change hypothesis?
Responsibility

Upon figuring this all out, Susan was quite upset.

She was amazed that farmers in the Midwest might be to blame for the lack of shrimp in the water off the Louisiana coast.
Suppose you are on a government panel studying the Dead Zone problem.

21. a) What recommendations would you make for solving the problem of the Dead Zone?
22. Consider all of the ideas for solving the problem. Why might it be difficult to enact any of these solutions?

- Make a watershed-wide plan.
- Restore wetlands and forests
- Establish a nitrogen credit system with incentives for the agricultural industry to reduce nitrogen-based fertilizers.
- Develop (GM) crops that need less fertilizer

2008 Plan by EPA
The four hypotheses for the Dead Zone:

- Hurricane Katrina (crossed out)
- Pollution & *Eutrophication* (highlighted)
- Climate Change
- Overfishing
- Oil Spill
23. Suggest reasons why eutrophication is not a problem in S. America and Africa.
Consider that a relevant political theme for this time period is state rights and federal rights. The federal government creates policies that affect all states, and some states feel that federal rights should not supersede the rights of states.

24. Which governing body should monitor and protect the waterways: state governments or federal governments. Why?
This case study has attempted to simulate how ecologists go about solving a problem. In this case, the problem was the Dead Zone in the Gulf of Mexico. Now is the time to summarize what you have learned.

Create a descriptive essay OR a concept map OR and infographic that:

1) Explains the problem using relevant/appropriate vocabulary
2) Discusses how ecologists determined the actual cause(s) of the problem (include evidence)
3) Proposes steps to solve the problem
